Description

Create an application in which a user can post a comment to a wall and read other user comments posted to the wall. Feel free to keep the application as simple as possible.

Technical Specifications

- **Overall Requirements**
  - Completed in the LAMP stack

- **Submission Requirements**
  - The application must include fields for accepting a name, email, website, and comment.
  - The name and comments fields are required and the user must be alerted if any of them aren't filled in upon submission.
  - Submitted comments should show up on the wall without a page refresh.

- **Comment Listing Requirements**
  - By default, list submitted comments in descending order above the comment submission form.
  - Comment listings should include name, comment, gravatar based on user submitted email, and time submitted.
  - If there is not a user submitted email, do not display an image next to the comment at all.
  - If the user user submits an email address, their displayed name should be a mailto link to their email address.
  - If the user submits a website, their displayed name should be a link to the website with a target "_blank" attribute.
  - If a user submits a name and an email address, their displayed name should be a link to the website with a "_target" blank attribute.
  - Allow the user to sort the comments posted to the wall by date submitted descending or ascending.

- **Non Requirements**
  - Comments do not need to be approved before being posted to the wall.
  - The submission form and the comment wall do not need to be styled.
